Announcements

Lab 7 (Scrollytelling) out, due Friday

Final Project Proposal (and groups) due Friday

FAQs:

1. What happens to lab checkoff OH after this week? They all become project / general OH.

About Project Grading

Fulfill all project requirements = 9/10.

Going above and beyond (e.g. polish, creative encoding, storytelling) = extra points.

Mistakes (overplotting, ineffective encodings) = minus points.

9/10 means that you made a good visualization with no issues.

10/10 means that you made an outstanding visualization that could be published in the news / a scientific paper.

9/10: Solid visualization with no issues.

How have race times changed over the years?

9/10: Solid visualization with no issues.

10/10: Publication-ready visualization:

Title states most important takeaway.

Annotations tell story.

No one is coming close to Usain Bolt's best times

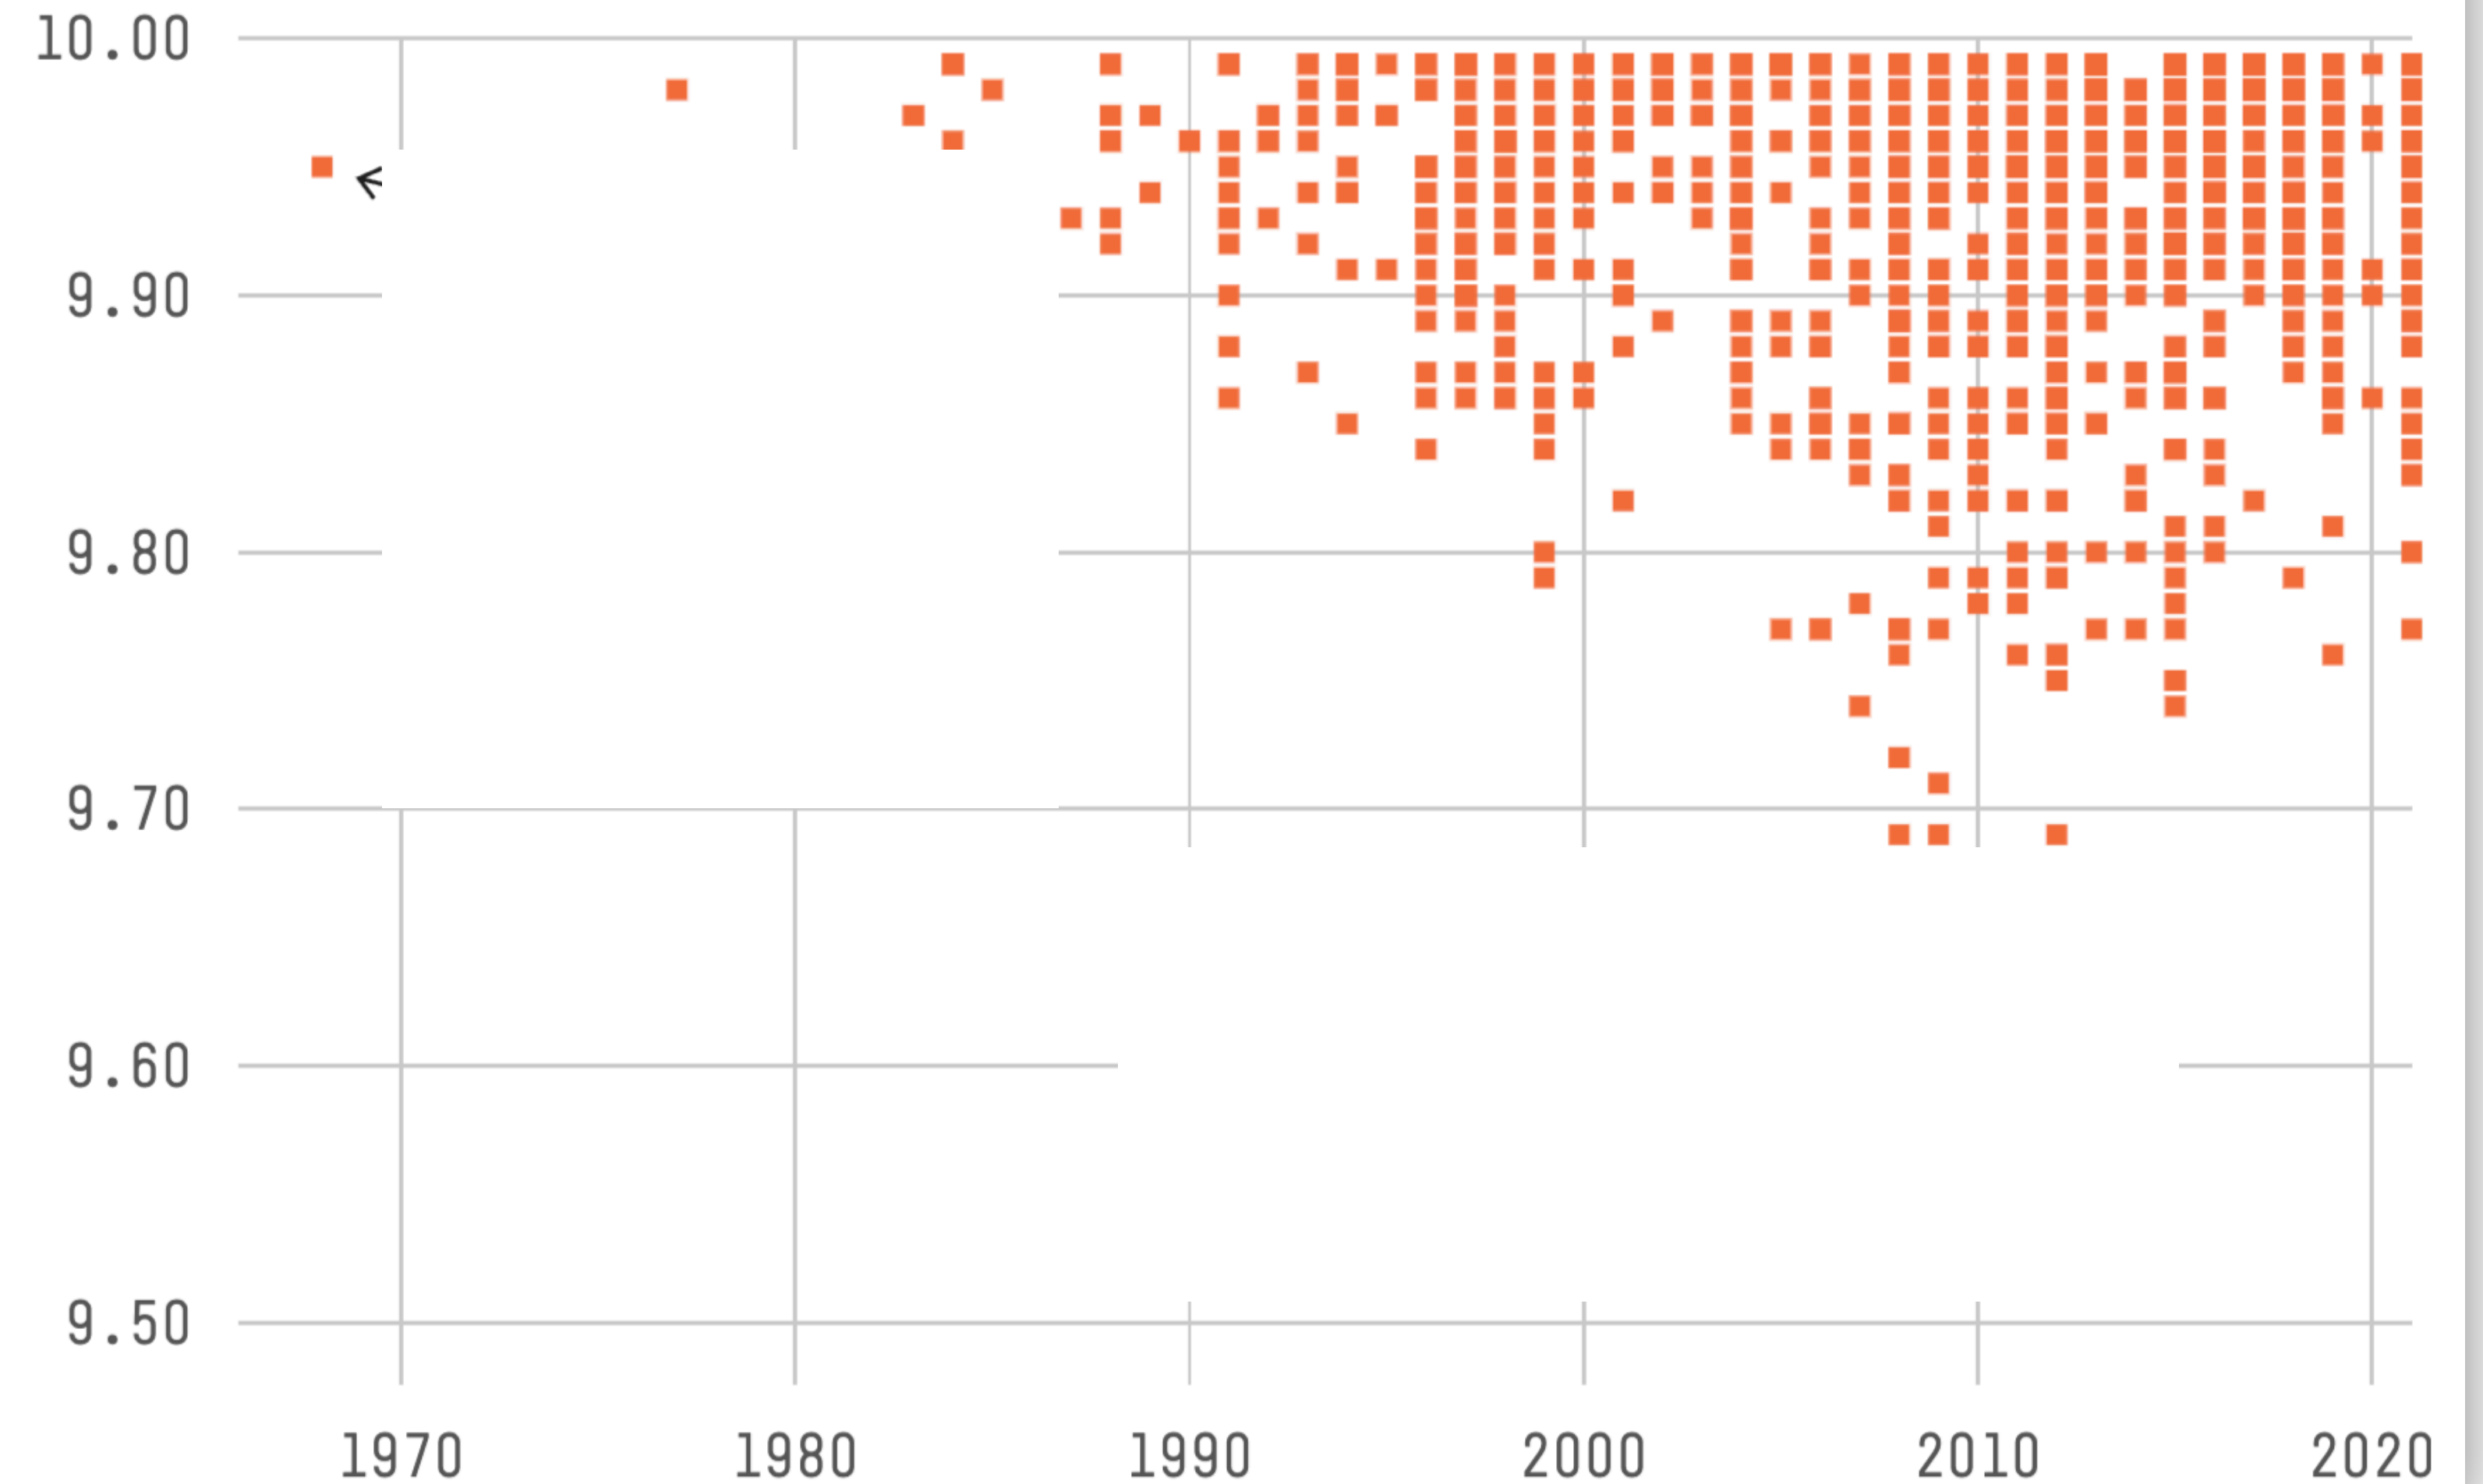

All times under 10 seconds in the outdoor men's 100-meter sprint, using only electronic readings and under regular wind conditions

9/10: Solid visualization with no issues.

8.5/10: Title not a research question or an interesting takeaway

100m Sprint race times vs. year

Why 9/10 if I met requirements?

Fulfilling requirements = visualization that's useful for **you**.

But goal of the class is to have you create visualizations that are useful for **other people**, which means going above basic requirements.

That said, we will create clearer rubrics from now on!

Follow the lives of 932 boys who grew up in rich families ...

...and see where they end up as adults:

Most white boys raised in wealthy families will stay rich or upper middle class as adults, but black boys raised in similarly rich households will not.

Adult outcomes reflect household incomes in 2014 and 2015.

Even when children grow up next to each other with parents who earn similar incomes, black boys fare worse than white

Tinker With a **Neural Network** Right Here in Your Browser. Don't Worry, You Can't Break It. We Promise.

You Try:
<https://bit.ly/nn-play>

The screenshot shows the TensorFlow Playground interface. At the top, there are controls for Epoch (000,000), Learning rate (0.03), Activation (Tanh), Regularization (None), and a 'Reg' dropdown. Below this is the 'DATA' section with dataset selection icons, a 50% training to test data ratio slider, Noise (0) slider, and Batch size (10) slider, along with a 'REGENERATE' button. The 'FEATURES' section lists input properties: X_1 , X_2 , X_1^2 , X_2^2 , $X_1 X_2$, $\sin(X_1)$, and $\sin(X_2)$. The neural network structure is shown with 2 hidden layers: the first has 4 neurons and the second has 2 neurons. Weights are represented by line thickness between neurons. The 'OUTPUT' section shows Test loss (0.525) and Training loss (0.517), along with a scatter plot of data points (orange and blue) and a decision boundary. A legend indicates that colors show data, neuron, and weight values, with a color scale from -1 (blue) to 1 (orange). Checkboxes for 'Show test data' and 'Discretize output' are at the bottom right.

The Economist

Service industries are less volatile than manufacturing, make up a bigger slice of rich-world GDP and, by their nature, trade less. That they remain strong largely reflects relatively buoyant labour markets and consumers (German unemployment is only 3.1%). One exception has been Britain, where survey data released on April 1st and 3rd appear to show growth in manufacturing at its strongest in over a year and services shrinking. Both findings are Brexit-related. The British economy is suffering from falling confidence, while manufacturing appears so strong only because firms are stockpiling in case Britain soon crashes out of the EU without a deal.

In the 2000s some economists speculated that the growing weight of

WHERE DID ALL THE MONEY GO?

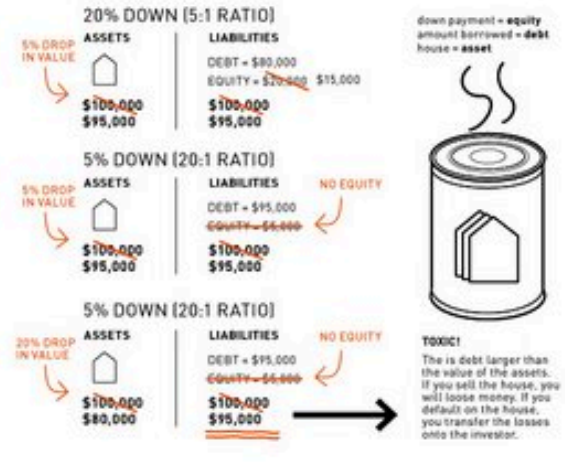

Easy Credit

No cash? No problem! As the global economy grew, the amount of money available for investment grew exponentially. Since a loan is a high yielding investment, there was a huge incentive to give out as many loans as possible, generating a society dependent on credit. Companies and individuals alike rely on credit to purchase even their most basic needs. Currently, US household debt adds up to a 100% of our GDP. That means that private Americans alone hold as much debt as the entire country produces in a year. This has happened only once before - in 1929.

Debt Turns Toxic

When you take out a loan on a house, you are employing one of the most basic tools of finance - leverage. You are taking on debt to supplement your savings (your equity) in order to buy an asset - the house. The higher the leverage (lower down payment), the riskier the investment. Watch what happens when the house prices fall.

Investors

The global economy has been growing fast. It has been acquiring enormous amounts of capital. This money had to be invested somewhere. The CDOs were particularly appealing because they were perceived as safe and they yielded a high interest rate at a time when the U.S. Bonds were at a record low.

Demand Lowers Standards

As the demand for Mortgage Securities grew, the supply dried up. Everyone who qualified for a loan and wanted one, already had one. In order to generate more loans to satisfy the growing demand for securities, the standards for getting a loan were lowered. Not only did this create "toxic" loans (packaged into toxic securities), but it also triggered the burst of the housing bubble. As the house prices peaked, the average income stayed flat. People couldn't afford to buy the overpriced houses. The housing market stopped, the prices fell & everyone found themselves owing a lot more than they owned.

Credit Crisis

The toxic assets made their way through the financial system quickly. After several investment firms "broke the bank" - losing the investor's money, and several major companies nearly collapsed, full blown panic set in. No one knew who was going to go under next. Because the assets they were holding were so complex, unregulated, and interconnected no one even knew to what extent their own assets were exposed. Lending stopped.

Easy Credit

Started by growing foreign capital

Housing Boom

Easy credit means more people can buy houses. The increased demand drives the house prices up.

Mortgage Securitization

Mortgage backed securities and CDOs are in high demand on the stock market. Virtually all the mortgages are securitized and traded. Banks are able to take their risk and move off their balance sheets and acquire new ones lending money on the loan.

Market Saturation

The easy credit allowed everyone who wanted a house to get one. The demand for CDO's still remained high.

Lowered Loan Standards

Borrowers needed to come up with ways to give out more loans. One obvious way was to lower the requirements for who could get a loan. Since they were selling the loan off, making money through a one time fee and bearing no risk of the loan default, it didn't matter if the loans would ever get paid back or not.

Global Economic Downturn

Lack of credit caused a mad cycle of stock selloffs, bankruptcies, cutbacks, higher unemployment, lower spending & production. The global economy is shrinking. There is less money to go around.

Credit Crisis

Toxic assets, toxic companies and panic virtually stopped lending. Some investors/banks stopped lending because they were afraid that they would never get their money back, while others found an easier banked strategy could not afford to lend. They had lost so much capital that they had nothing to lend out.

Subprime Crisis

Throughout the housing boom, the financial market had grown dependent on the idea that house prices would fall. Assets that were thought to be safe were only safe because they were backed by houses of increasing value. When the prices did fall, the entire system was forced on its head.

House Prices Fall

The unthinkable happens, house prices start falling drastically. There are a few reasons for this. At the time when the house prices were consistently going up, the average household income stayed the same. Even with the easy loans, people simply couldn't afford the houses anymore. They stopped buying. This meant that the natural supply/demand balance (as more houses were sold being built) and the market had to correct itself.

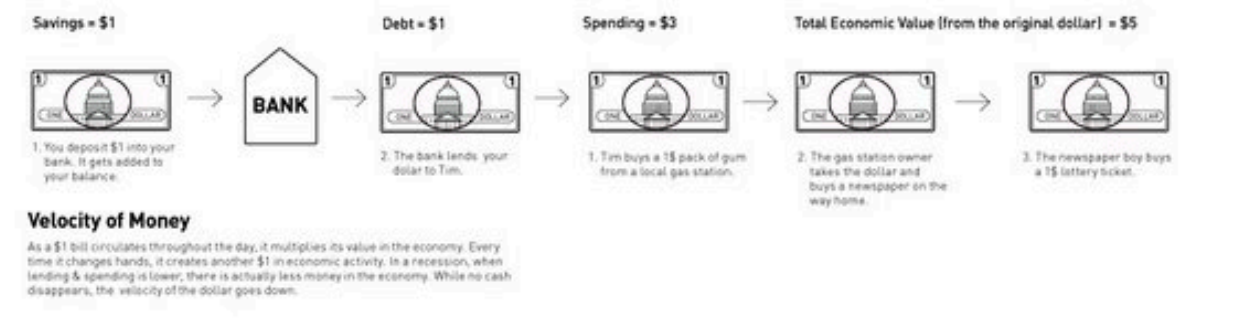

What is money?

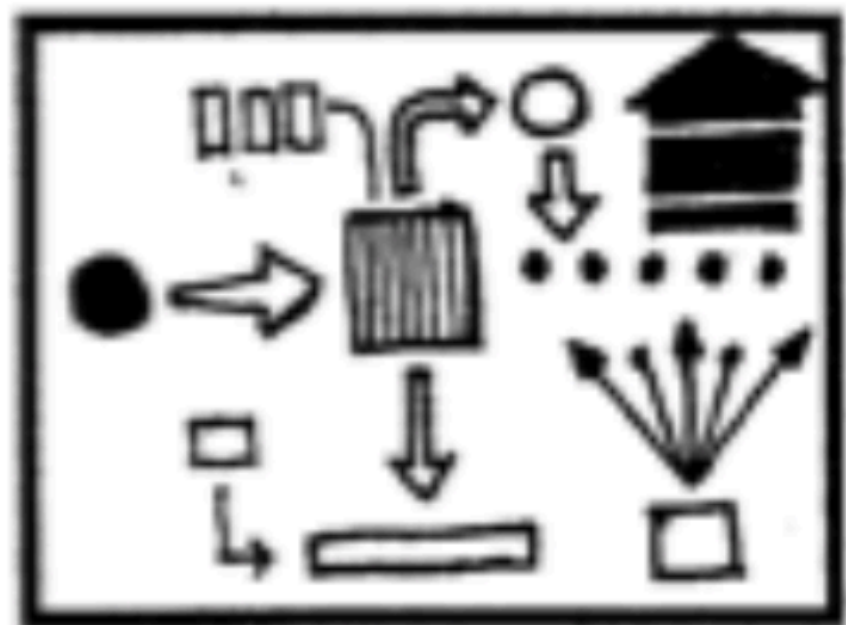

Money can be anything. Rare & valuable resources have been used historically because they are easy to control, but anything that people collectively agree on can be used as money. There are four general functions money fulfills: medium of exchange, unit of account, store of value & standard of deferred payment. Money needs to have a perceived value. This is an overview of the different forms of money and where their value comes from.

Money Supply

The Money Supply is the amount of available money in the economy. It fluctuates with the market. In times of economic growth, the money supply is high. In a recession, the money supply is low. Lending and spending are two major factors that influence the money supply.

Steroids or Not, the Pursuit Is On

Barry Bonds is taking aim at the career home run record. He needs only six more to tie Babe Ruth and 47 to equal Hank Aaron.

Lines are cumulative home runs.

Hank Aaron
755 homers
23 seasons

Babe Ruth
714 homers
22 seasons

Barry Bonds
708 homers
20 seasons

Bonds takes lead
Home runs
after 16 seasons
Bonds 567
Aaron 554
Ruth 516

600

400

14th season

According to allegations in a book about Bonds, he began taking steroids before the 1999 season, his 14th in the league. Two seasons later, he hit 73 home runs, surpassing Aaron's career pace.

Homer Pace After Age 34

If the accusations are correct, Bonds was 34 in his first season on steroids. Here are projected home run paces for each player after age 34.

----- PROJECTED PACE BASED ON AVERAGE OF PREVIOUS FIVE SEASONS

Aaron

Actual homers slightly outpace projected homers for five seasons.

Ruth

Averaged 46.4 homers a season from age 30 to 34. Averaged 42.5 for next four seasons.

Bonds

From age 35 to 39, he averaged 14 more homers a season than projected.

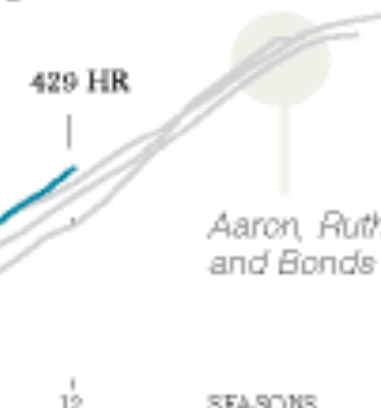

Note: Ages as of July 1 of each season.

Others Taking Aim

Alex Rodriguez

Is ahead of the pace set by all three home run leaders.

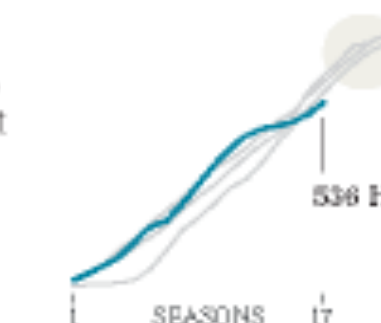

Albert Pujols

Averaging 40 homers a season, he has started stronger than the three leaders did.

Ken Griffey Jr.

Many thought he would be the first to catch Ruth and Aaron until injuries limited his output.

Differing Paths to the Top of the Charts

The top seven players on the career home run list, along with a look at Griffey (12th), Rodriguez (37th) and Pujols (tied 257th).

On the Map: Five Major North Korean Prison Camps

North Korea has operated political prison camps for more than 50 years, twice as long as the Gulag in the former Soviet Union. People suspected of opposing the government are forced to do slave labor in the camps, which hold an estimated 200,000 prisoners. North Korea's government says the camps don't exist, but high-resolution satellite images show otherwise.

A visual introduction to machine learning

English

In machine learning, computers apply **statistical learning** techniques to automatically identify patterns in data. These techniques can be used to make highly accurate predictions.

Keep scrolling. Using a data set about homes, we will create a machine learning model to distinguish homes in New York from homes in San Francisco.

“Scrolly”-telling

SCROLL

Discrete vs. Continuous Steps

A source of debate among practitioners!

Interactive Slideshow

Discrete

- ✓ Simple & familiar.
- ✗ But less engaging?

Continuous

- ✓ Less “activation energy” required.
- ✓ More fluid/direct: parameterized by scroll position = rapid, incremental experience.
- ✗ But, difficult to implement properly. Can result in “*scrolljacking*.”

Kernel Density Estimation

By: [Matthew Conlen](#)

What do **matrices** mean to you?

Why do we need a way to represent an array of rows and columns of numbers, and to execute computations and operations between them?

$$\begin{bmatrix} 1 & 2 \\ -2 & 0 \end{bmatrix} \begin{bmatrix} -1 \\ 2 \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \end{bmatrix}$$

In school, you may recall reluctantly performing drill after drills of matrix-vector multiplications mechanically. You may even have been taught to memorize several inane formulas.

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = x \begin{bmatrix} a \\ c \end{bmatrix} + y \begin{bmatrix} b \\ d \end{bmatrix} \\ = \begin{bmatrix} ax + by \\ cx + dy \end{bmatrix}$$

RECAP

- Any vector can be expressed as the addition of scaled basis vectors, i.e. **a linear combination of basis vectors**.
- A matrix can be viewed as a way to **package information about a linear transformation**. The columns of a matrix represent where the new basis vectors land after the transformation.
- Matrix-vector multiplication is a way to compute where a given vector lands after the transformation defined by a matrix.

With our understanding so far, try to tinker about and figure out what kinds of transformations are possible with matrices!

$$\begin{bmatrix} 1.0 & 2.0 \\ -2.0 & 0.0 \end{bmatrix} \begin{bmatrix} -1.0 \\ 2.0 \end{bmatrix} = \begin{bmatrix} 3.0 \\ 2.0 \end{bmatrix}$$

Final Project:

Explorable Explanation

Final Project

Create an **Explorable Explanation**: interactive article that explains something complex to the reader.

Examples: Any example shown during today's lecture, sociological theory, scientific phenomenon, algorithm, etc.

Banned: sorting + searching algorithms. (Too common!)

Teams of 2-3. **No solo projects.**

Final Project Milestones

Proposal + Team: Feb 23 (this Friday)

Prototype: Mar 1

Demo Video: Mar 8

Final Project: Mar 16

← No slip days allowed for final deadline
