Announcements

Lab 3 (JavaScript) out, checkoffs due 1/26.

Project 2 out, due on Friday 2/2.

In-person OH moved to HDSI 355 (not 1st floor!)

Sam's OH moved to 1pm on Thurs, not 2pm

FAQs:

1. When will Project 1 be graded? Aiming for Friday.

Project 2: Deceptive Visualization

Task: Create two static visualizations. One is **earnest**. One is **deceptive**.

Earnest = understandable, appropriate encodings, transparent

Deceptive = deliberately misleading, biased headings, not transparent.

Should be hard to tell which one is deceptive! Can't lie (e.g. change data values).

You will peer review 3 other students' submissions.

Quick Poll

1. Did you feel like you could get adequate OH help for Project 1?

Visible Light

Light is an electromagnetic wave.

Wavelength (λ) between **370nm – 730nm**.

Color depends on the *spectral distribution function* (or **spectrum**): distribution of “relative luminance” at each wavelength.

Area under the spectrum is **intensity**: or how bright each wavelength is.

[Maureen Stone. A Field Guide to Digital Color, 2003]

Visible Light

Light is an electromagnetic wave.

Wavelength (λ) between **370nm – 730nm**.

Color depends on the *spectral distribution function* (or *spectrum*): distribution of “relative luminance” at each wavelength.

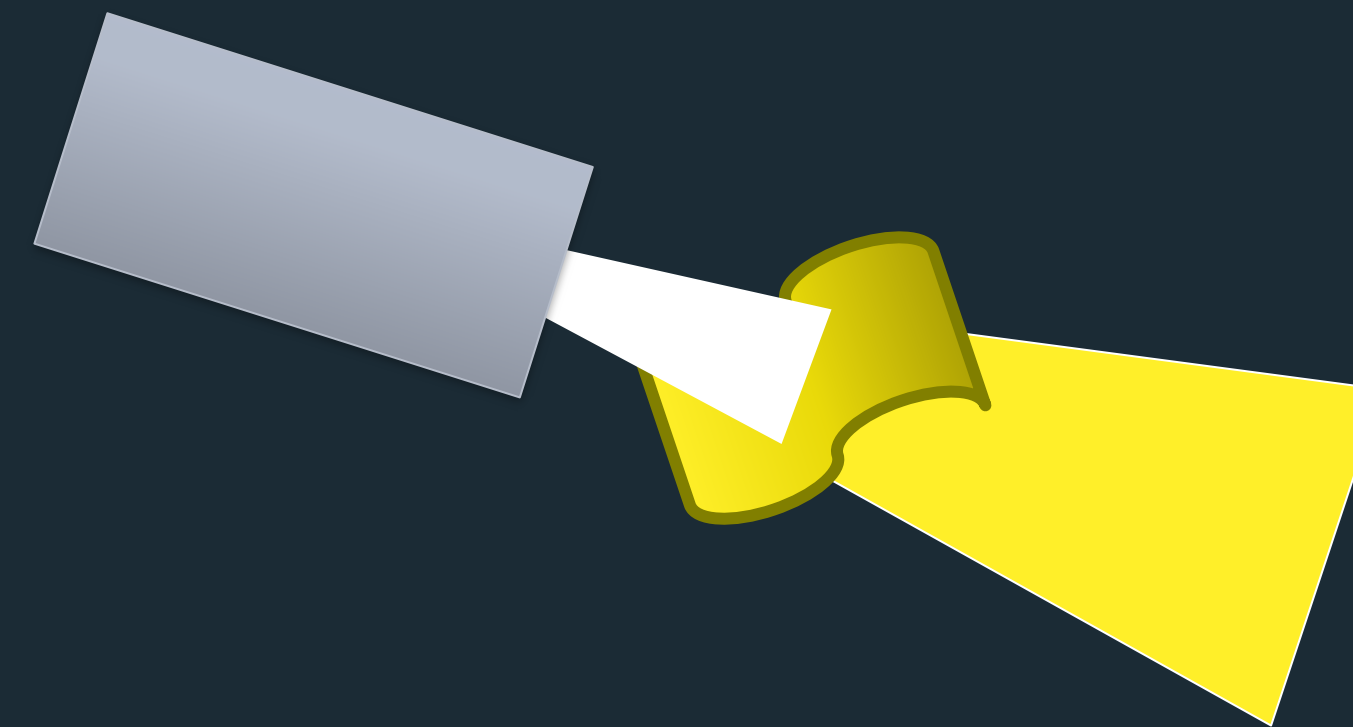

Area under the spectrum is *intensity*: or how bright each wavelength is.

Additive: Perceived color is due to a combination of source lights (e.g., RGB).

Subtractive: Start from a white spotlight, and materials absorb specific λ s (e.g., RYB or CMYK).

Additive
(digital displays)

Subtractive
(print, e-paper)

cones – sensitive to different wavelengths = color vision!
short, middle, long ~ blue, green, red

The Retina

Photoreceptors on retina are responsible for vision:
rods – low-light levels, poor spatial acuity, little color vision
cones – sensitive to different wavelengths = color vision!
short, middle, long ~ blue, green, red
integrate against different input stimuli

[Maureen Stone. *A Field Guide to Digital Color*, 2003]

tri-stimulus response – color can be modeled as 3 values.

The Retina

Photoreceptors on retina are responsible for vision:
rods – low-light levels, poor spatial acuity, little color vision
cones – sensitive to different wavelengths = color vision!
long, middle, short ~ red, green, blue
integrate against different input stimuli
tri-stimulus response – color can be modeled as 3 values.

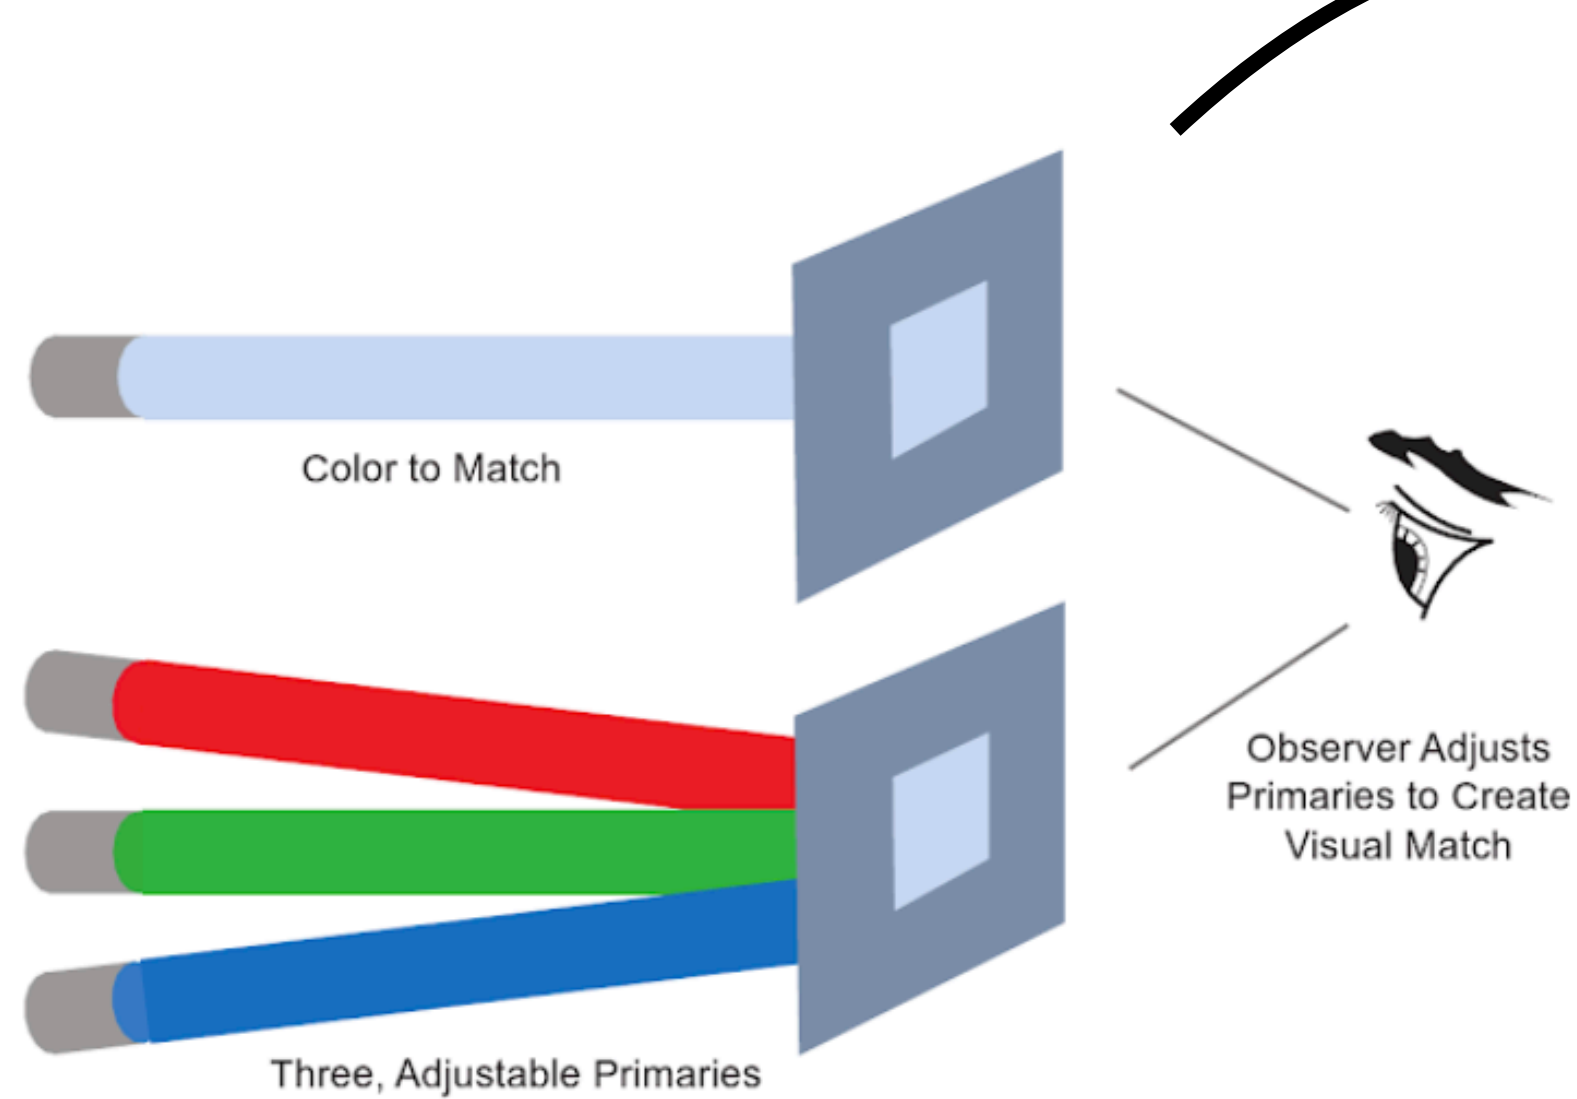

metamers – spectra that stimulate the same LMS response are indistinguishable.

CIE XYZ

Color space standardized in 1931 to mathematically represent tri-stimulus response curves.

empirically determined

Red = 645nm
Green = 525nm
Blue = 444nm

mathematic transformation
No real lights can the x, y, z
response curves.

CIE XYZ

Color space standardized in 1931 to mathematically represent tri-stimulus response curves.

CIE XYZ Color Space

Project into a 2D plane to separate colorfulness from brightness.

$$x = \frac{X}{X + Y + Z}$$

$$y = \frac{Y}{X + Y + Z}$$

$$1 = x + y + z$$

C.I.E. 1931 Chromaticity Diagram

CIE XYZ Color Space

$$x = \frac{X}{X + Y + Z}$$

$$y = \frac{Y}{X + Y + Z}$$

$$1 = x + y + z$$

Spectral locus – set of pure colors (i.e., lasers of a single wavelength).

Slowly shifts from S → M → L.

C.I.E. 1931 Chromaticity Diagram

CIE XYZ Color Space

Display gamut = portion of the color space that can be reproduced by a display.

CIE XYZ Color Space

Display gamut = portion of the color space that can be reproduced by a display.

CIE XYZ Color Space

Display gamut = portion of the color space that can be reproduced by a display.

The angry rainbow in sRGB.

Corners of sRGB

Photoshop grayscale

No linear brightness gradient within a single hue.

CIE LAB Color Space

Axes correspond to opponent signals:

L^* = luminance

a^* = red-green contrast

b^* = yellow-blue contrast

CIE LAB Color Space

Axes correspond to opponent signals:

L^* = luminance

a^* = red-green contrast

b^* = yellow-blue contrast

CIE LAB Color Space

More perceptually uniform than sRGB.
Scaling of axes such that distance in color space is proportional to perceptual distance.

The angry rainbow in sRGB.

A happier rainbow in LAB.

Better. But still be wary.

Simultaneous Contrast

When two colors are side-by-side, they interact and affect our perception

The inner and outer thin rings are, in fact, the same physical purple!

Simultaneous Contrast

When two colors are side-by-side, they interact and affect our perception

Josef Albers

Simultaneous Contrast

When two colors are side-by-side, they interact and affect our perception

Josef Albers

Simultaneous Contrast

When two colors are side-by-side, they interact and affect our perception

Josef Albers

Bezold Effect

Color appearance depends on adjacent colors

E.g., adding a dark border around a color can the color appear darker.

Chromatic Adaptation

Our ability to adjust to color perception based on illumination

Jason Su

Chromatic Adaptation

Our ability to adjust to color perception based on illumination

Jason Su

Chromatic Adaptation

Our ability to adjust to color perception based on illumination

Quantitative Color Encoding

Sequential Color Scale

Ramp in luminance, possibly also hue.
Typically higher values map to darker colors.

Diverging Color Scale

Useful when data has a meaningful “midpoint.”
Use neutral color (e.g., gray) for midpoint.
Use saturated colors for endpoints.

Limit number of steps in color to 3–9

number of data classes on your map

+10 achromatic chips

Color Naming

Is color naming universal? Do languages evolve color terms in similar ways?

WCS stimulus array. For each basic color term (t) participants named, they were asked:

1. Mark all chips that you would call t .
2. Which chip is the best example(s) of t .

Color Naming

Is color naming universal? Do languages evolve color terms in similar ways?

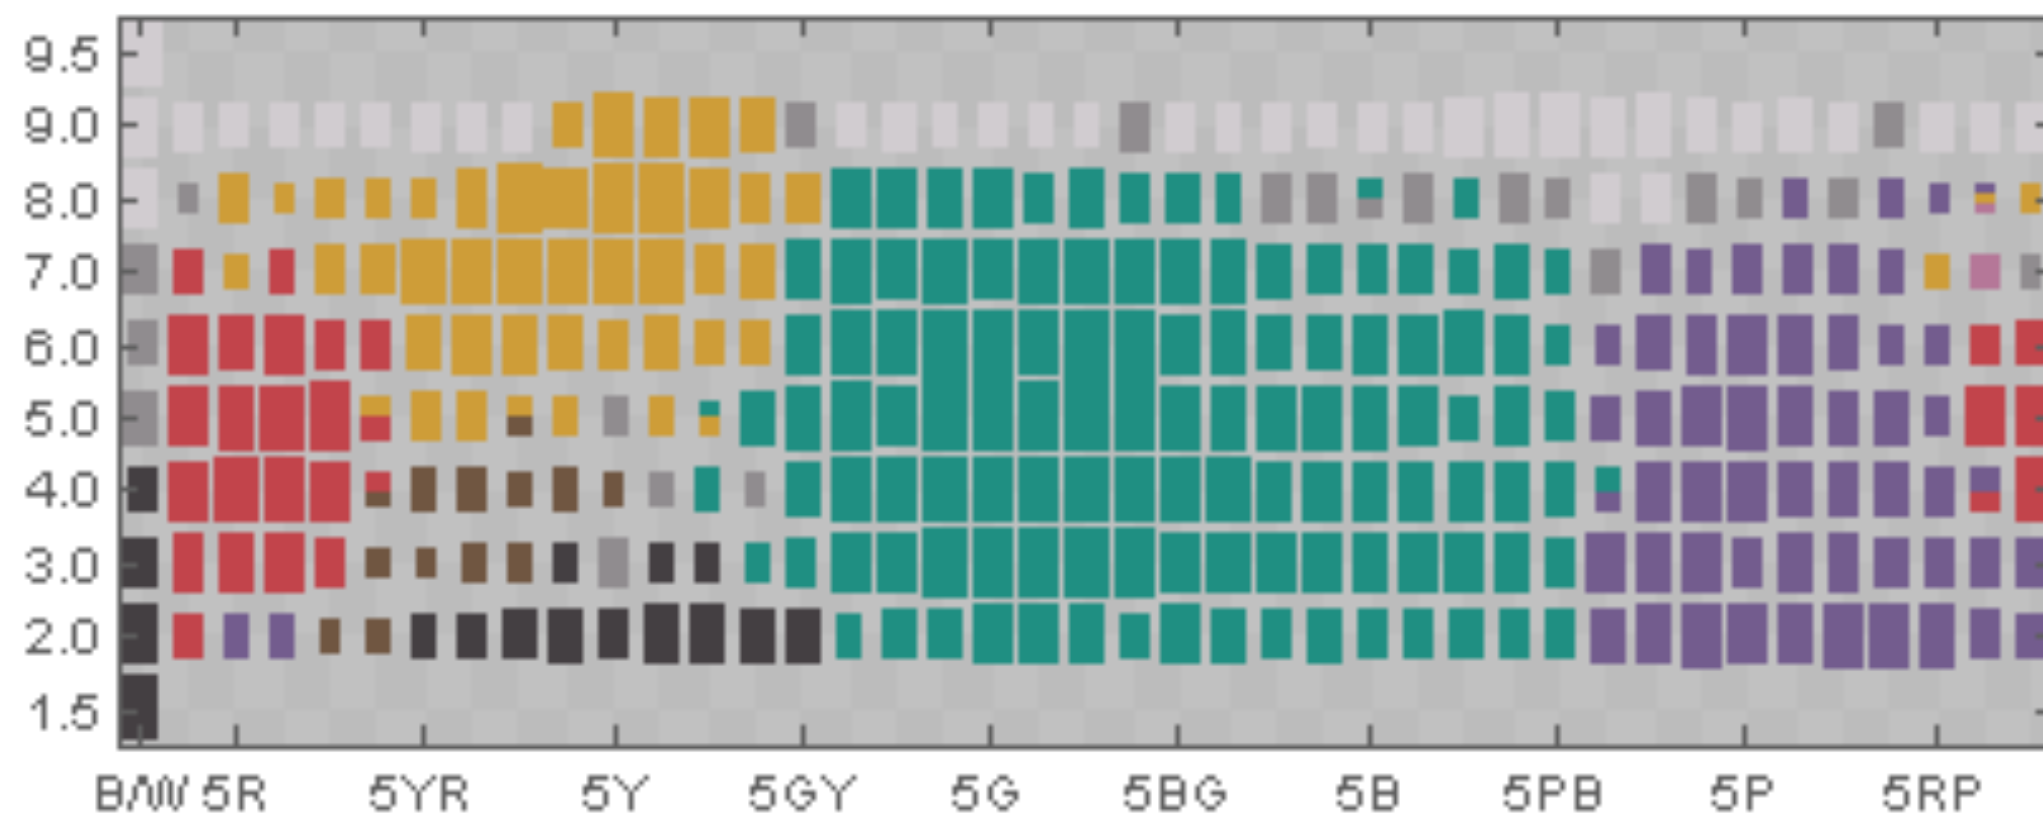

Language #72 (Mixteco)
Mutual info = 0.942 / Contribution = 0.476

Language #19 (Camsa)
Mutual info = 0.939 / Contribution = 0.487

Language #98 (Tlapaneco)
Mutual info = 0.942 / Contribution = 0.524

Language #24 (Chavacano)
Mutual info = 0.939 / Contribution = 0.513

Color Naming

Is color naming universal? Do languages evolve color terms in similar ways?

Basic color terms recur across languages:

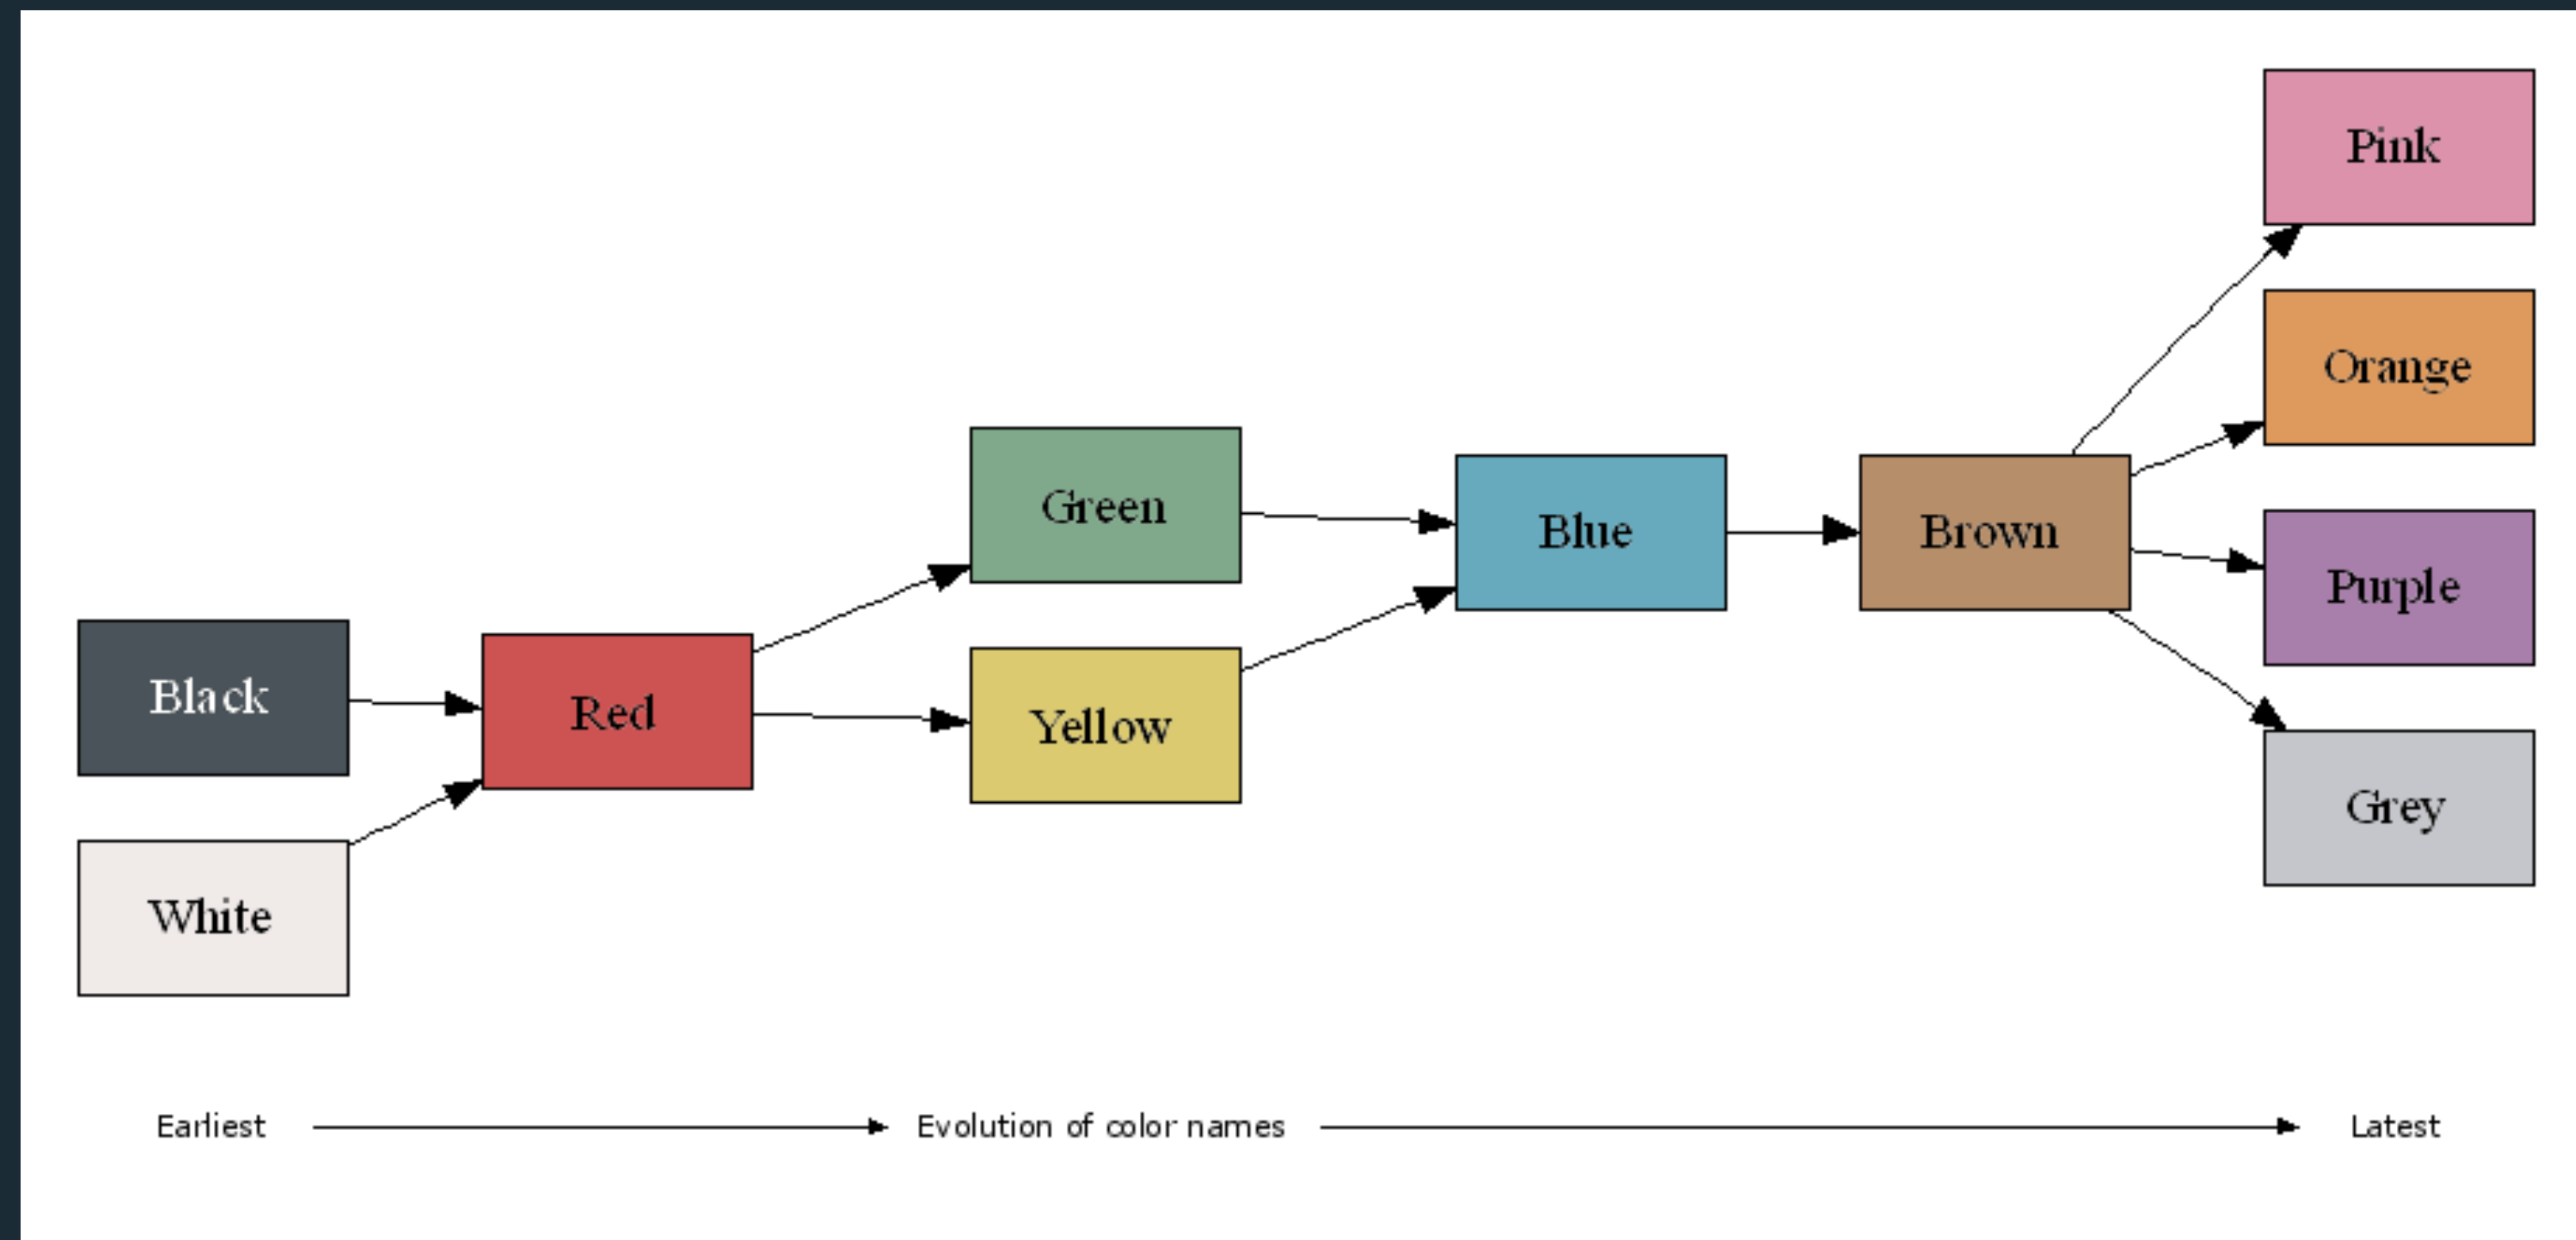

White Black Grey

Red Yellow

Green Blue

Pink Brown

Orange Purple

Color Naming

Is color naming universal? Do languages evolve color terms in similar ways?

Winawer et al, 2007.

Russian makes obligatory distinction between lighter blues (“goluboy”) and darker blues (“siniy”).

Russian speakers **were faster** at discriminating 2 colors if they fell into different categories (1 siniy, 1 goluboy) than if they were both from the same category (both siniy, or both goluboy).

Color Naming Effects Perception

Quantitative Color

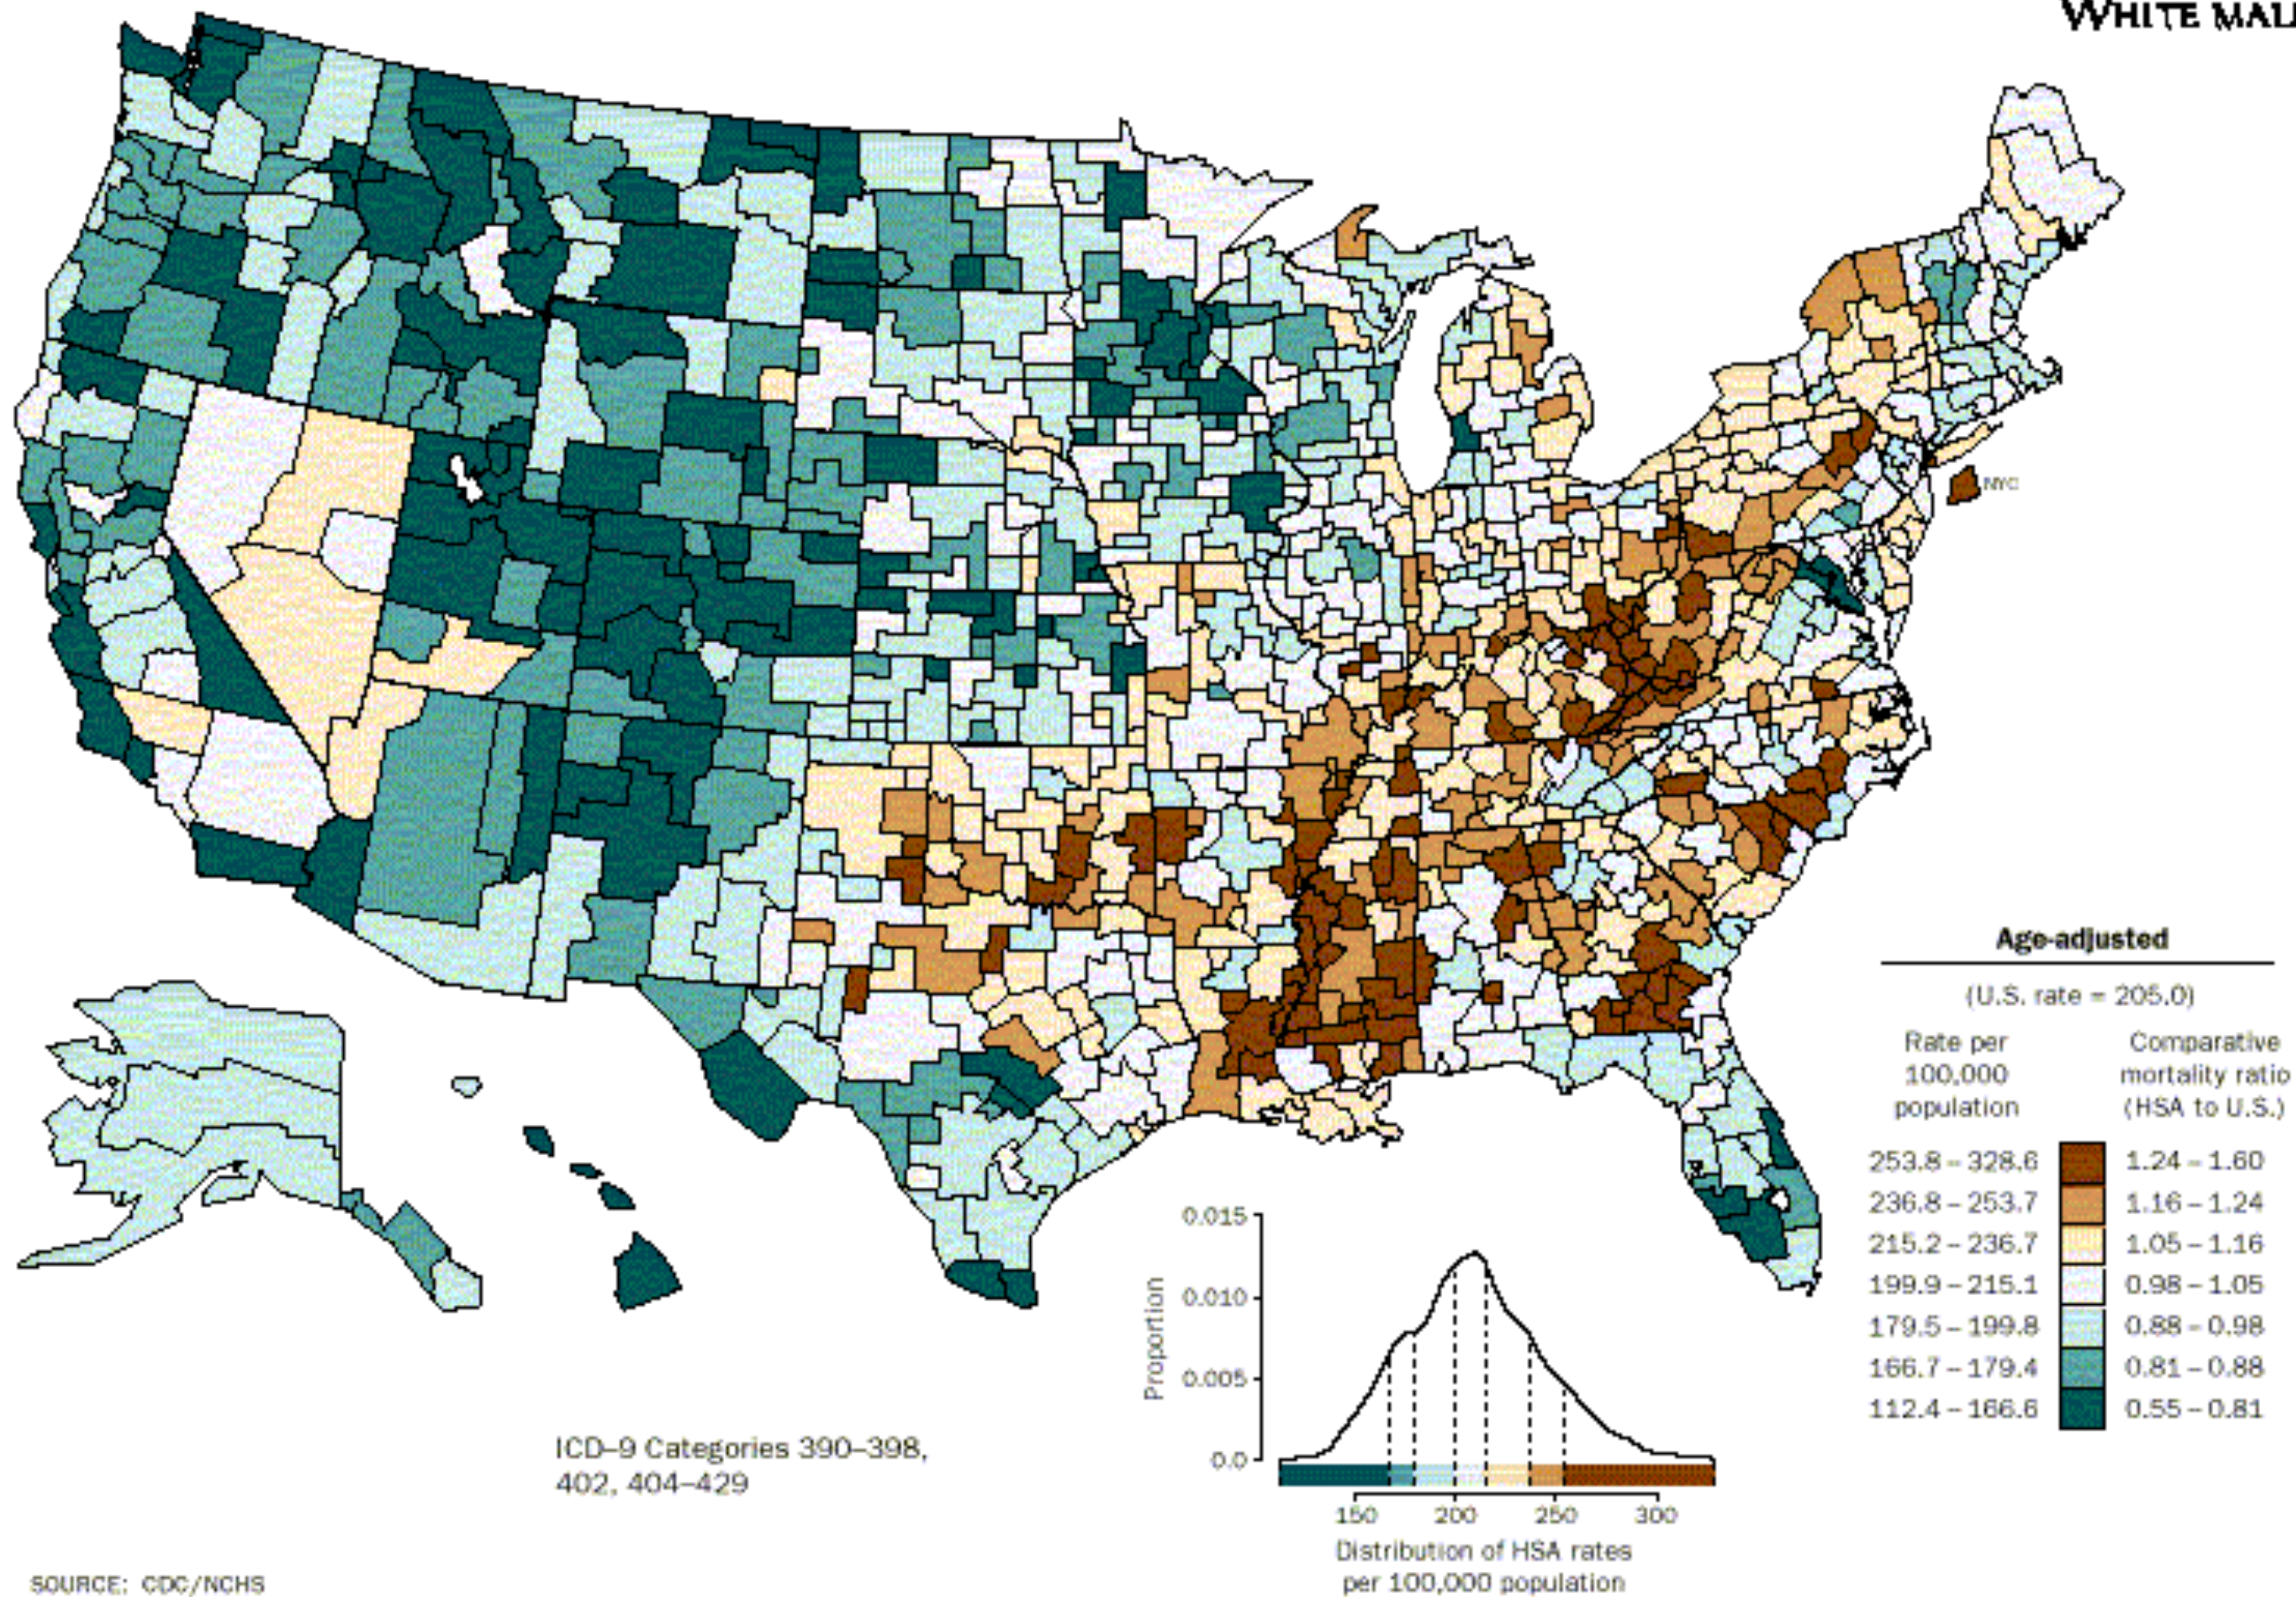

Be Wary of Naive Rainbows!

1. Hues are not naturally ordered
2. People segment colors into classes, perceptual banding
3. Naive rainbows are unfriendly to color blind viewers
4. Some colors are less effective at high spatial frequencies

Diverging Color Schemes

Summary

Use **only a few** colors (~6 ideally).

Colors should be **distinctive** and **named**.

Strive for color **harmony** (natural colors?).

Use/respect **cultural conventions**; appreciate symbolism.

Get it right in **black and white**.

Respect the **color blind**.

Take advantage of **perceptual color spaces**.
