#### Lecture 9 – Regression in Action and Linear Algebra Review

DSC 40A, Spring 2023

#### Announcements

- Homework 3 is due **Tuesday at 11:59pm**.
  - Come to office hours. See dsc40a.com/calendar for the schedule.
  - It's a pretty long homework. Start early!
- Solutions to Groupwork 3 and Homework 2 are now available on Campuswire.
  - Reviewing them will help you on upcoming assignments and exams.

#### Agenda

- Recap of Lecture 8.
- Connection with correlation.
- Interpretation of formulas.
- Regression demo.
- Linear algebra review.

**Recap of Lecture 8** 

### The best linear prediction rule

Last time, we used multivariable calculus to find the slope w<sub>1</sub><sup>\*</sup> and intercept w<sub>0</sub><sup>\*</sup> that minimized the MSE for a linear prediction rule of the form

$$H(x) = w_0 + w_1 x$$

In other words, we minimized this function:

$$R_{sq}(w_0, w_1) = \frac{1}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i))^2$$

### **Optimal parameters**

We found the optimal parameters to be:

$$w_1^* = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^n (x_i - \bar{x})^2} \qquad \qquad w_0^* = \bar{y} - w_1 \bar{x}$$

To make predictions about the future, we use the prediction rule

$$H^*(x) = W_0^* + W_1^* x$$

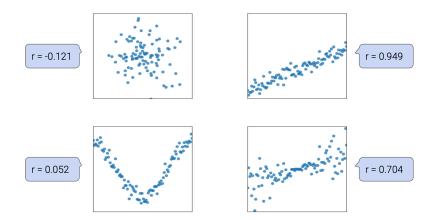

► This line is the **regression line**.

# **Connection with correlation**

## **Correlation coefficient**

- ▶ In DSC 10, you were introduced to the idea of correlation.
  - It is a measure of the strength of the linear association of two variables, x and y.
  - Intuitively, it measures how tightly clustered a scatter plot is around a straight line.
  - It ranges between -1 and 1.

#### Patterns in scatter plots

## **Definition of correlation coefficient**

- The correlation coefficient, r, is defined as the average of the product of x and y, when both are in standard units.
  - Let  $\sigma_x$  be the standard deviation of the  $x_i$ 's, and  $\bar{x}$  be the mean of the  $x_i$ 's.

• 
$$x_i$$
 in standard units is  $\frac{x_i - \bar{x}}{\sigma_x}$ .

The correlation coefficient is

$$r = \frac{1}{n} \sum_{i=1}^{n} \left( \frac{x_i - \bar{x}}{\sigma_x} \right) \left( \frac{y_i - \bar{y}}{\sigma_y} \right)$$

#### Another way to express $W_1^*$

It turns out that w<sub>1</sub><sup>\*</sup>, the optimal slope for the linear prediction rule, can be written in terms of r!

$$w_{1}^{*} = \frac{\sum_{i=1}^{n} (x_{i} - \bar{x})(y_{i} - \bar{y})}{\sum_{i=1}^{n} (x_{i} - \bar{x})^{2}} = r\frac{\sigma_{y}}{\sigma_{x}}$$

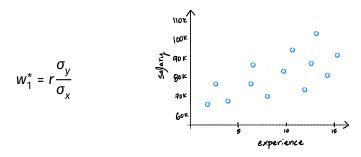

- It's not surprising that r is related to w<sub>1</sub><sup>\*</sup>, since r is a measure of linear association.
- Concise way of writing  $w_0^*$  and  $w_1^*$ :

$$w_1^* = r \frac{\sigma_y}{\sigma_x} \qquad w_0^* = \bar{y} - w_1^* \bar{x}$$

**Proof that** 
$$w_1^* = r \frac{\sigma_y}{\sigma_x}$$

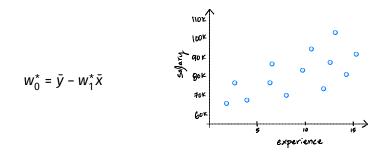

**Interpretation of formulas** 

#### Interpreting the slope

- σ<sub>y</sub> and σ<sub>x</sub> are always non-negative. As a result, the sign of the slope is determined by the sign of r.
- As the y values get more spread out,  $\sigma_y$  increases and so does the slope.
- As the x values get more spread out, σ<sub>x</sub> increases and the slope decreases.

#### Interpreting the intercept

• What is  $H^*(\bar{x})$ ?

#### **Discussion Question**

We fit a linear prediction rule for salary given years of experience. Then everyone gets a \$5,000 raise. Which of these happens?

- a) slope increases, intercept increases
- b) slope decreases, intercept increases
- c) slope stays same, intercept increases
- d) slope stays same, intercept stays same

# **Regression demo**

Let's see gradient descent in action. Follow along here.

Linear algebra review

## Wait... why do we need linear algebra?

- Soon, we'll want to make predictions using more than one feature (e.g. predicting salary using years of experience and GPA).
- Thinking about linear regression in terms of linear algebra will allow us to find prediction rules that
   use multiple features.

▶ are non-linear.

Before we dive in, let's review.

#### Matrices

- An m × n matrix is a table of numbers with m rows and n columns.
- ▶ We use upper-case letters for matrices.

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$$

► A<sup>T</sup> denotes the transpose of A:

$$A^{\mathsf{T}} = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}$$

#### Matrix addition and scalar multiplication

- We can add two matrices only if they are the same size.
- Addition occurs elementwise:

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} + \begin{bmatrix} 7 & 8 & 9 \\ -1 & -2 & -3 \end{bmatrix} = \begin{bmatrix} 8 & 10 & 12 \\ 3 & 3 & 3 \end{bmatrix}$$

Scalar multiplication occurs elementwise, too:

$$2 \cdot \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} = \begin{bmatrix} 2 & 4 & 6 \\ 8 & 10 & 12 \end{bmatrix}$$

### Matrix-matrix multiplication

We can multiply two matrices A and B only if

# columns in A = # rows in B.

- If A is m × n and B is n × p, the result is m × p.
  This is very useful.
- The *ij* entry of the product is:

$$(AB)_{ij} = \sum_{k=1}^{n} A_{ik} B_{kj}$$

## Some matrix properties

Multiplication is Distributive:

A(B+C)=AB+AC

Multiplication is Associative:

(AB)C = A(BC)

Multiplication is not commutative:

AB ≠ BA

Transpose of sum:

$$(A+B)^T = A^T + B^T$$

Transpose of product:

 $(AB)^T = B^T A^T$ 

#### Vectors

- An vector in  $\mathbb{R}^n$  is an  $n \times 1$  matrix.
- We use lower-case letters for vectors.

$$\vec{v} = \begin{bmatrix} 2\\1\\5\\-3 \end{bmatrix}$$

Vector addition and scalar multiplication occur elementwise.

#### Geometric meaning of vectors

A vector  $\vec{v} = (v_1, ..., v_n)^T$  is an arrow to the point  $(v_1, ..., v_n)$  from the origin.

► The length, or norm, of  $\vec{v}$  is  $\|\vec{v}\| = \sqrt{v_1^2 + v_2^2 + ... + v_n^2}$ .

#### **Dot products**

▶ The **dot product** of two vectors  $\vec{u}$  and  $\vec{v}$  in  $\mathbb{R}^n$  is denoted by:

 $\vec{u}\cdot\vec{v}=\vec{u}^T\vec{v}$ 

Definition:

$$\vec{u} \cdot \vec{v} = \sum_{i=1}^{n} u_i v_i = u_1 v_1 + u_2 v_2 + \dots + u_n v_n$$

The result is a scalar!

#### **Discussion Question**

Which of these is another expression for the length of  $\vec{u}$ ?

a) 
$$\vec{u} \cdot \vec{u}$$
  
b)  $\sqrt{\vec{u}^2}$   
c)  $\sqrt{\vec{u} \cdot \vec{u}}$   
d)  $\vec{u}^2$ 

#### Properties of the dot product

Commutative:

$$\vec{u}\cdot\vec{v}=\vec{v}\cdot\vec{u}=\vec{u}^T\vec{v}=\vec{v}^T\vec{u}$$

Distributive:

 $\vec{u}\cdot(\vec{v}+\vec{w})=\vec{u}\cdot\vec{v}+\vec{u}\cdot\vec{w}$ 

### Matrix-vector multiplication

- Special case of matrix-matrix multiplication.
- Result is always a vector with same number of rows as the matrix.

One view: a "mixture" of the columns.

$$\begin{bmatrix} 1 & 2 & 1 \\ 3 & 4 & 5 \end{bmatrix} \begin{bmatrix} a_1 \\ a_2 \\ a_3 \end{bmatrix} = a_1 \begin{bmatrix} 1 \\ 3 \end{bmatrix} + a_2 \begin{bmatrix} 2 \\ 4 \end{bmatrix} + a_3 \begin{bmatrix} 1 \\ 5 \end{bmatrix}$$

Another view: a dot product with the rows.

#### **Discussion Question**

If A is an  $m \times n$  matrix and  $\vec{v}$  is a vector in  $\mathbb{R}^n$ , what are the dimensions of the product  $\vec{v}^T A^T A \vec{v}$ ?

- a)  $m \times n$  (matrix)
- b) *n* × 1 (vector)
- c) 1 × 1 (scalar)
- d) The product is undefined.

#### Summary

#### Summary, next time

We can re-write the optimal parameters for the regression line

$$w_1^* = r \frac{\sigma_y}{\sigma_x} \qquad w_0^* = \bar{y} - w_1^* \bar{x}$$

- We can then make predictions using  $H^*(x) = w_0^* + w_1^*x$ .
- We will need linear algebra in order to generalize regression to work with multiple features.
- Next time: Continue linear algebra review. Formulate linear regression in terms of linear algebra.
