

Lecture 21 – Independence

DSC 40A, Winter 2024

Announcements

- ▶ Homework 7 will be released today
 - ▶ The second EC challenge will also be released, but does not count toward homework grade.
 - ▶ Last homework of this course!
- ▶ Midterm 2 will be on March 13rd
 - ▶ More information on next week's lecture

Agenda

- ▶ Recap of Lecture 20.
- ▶ Independence.

Last time

Last time

- ▶ A set of events E_1, E_2, \dots, E_k is a **partition** of S if each outcome in S is in exactly one E_i .
- ▶ The **Law of Total Probability** states that if A is an event and E_1, E_2, \dots, E_k is a partition of S , then

$$P(A) = P(A \cap E_1) + P(A \cap E_2) + \dots + P(A \cap E_k)$$
$$P(A) = P(E_1) \cdot P(A|E_1) + P(E_2) \cdot P(A|E_2) + \dots + P(E_k) \cdot P(A|E_k)$$

$$= \sum_{i=1}^k P(E_i) \cdot P(A|E_i)$$

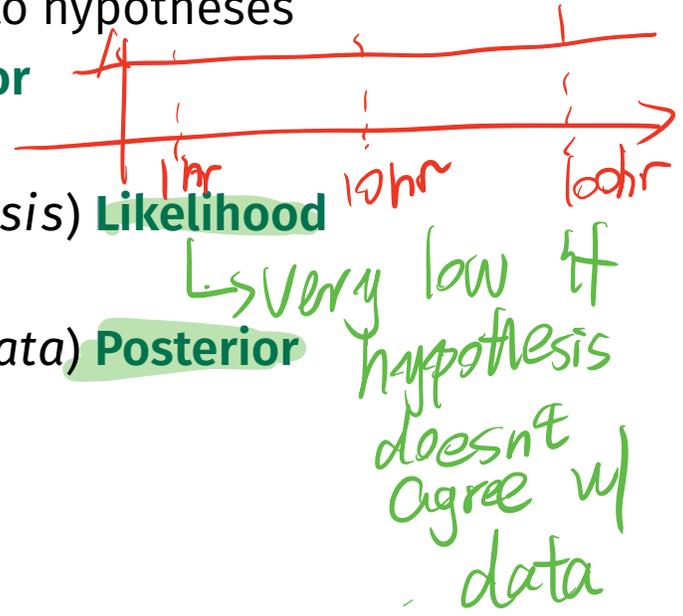

- ▶ **Bayes' Theorem** states that

$$P(B|A) = \frac{P(B) \cdot P(A|B)}{P(A)} \rightarrow P(A \cap B) + P(A \cap \bar{B})$$

- ▶ We often re-write the denominator $P(A)$ in Bayes' Theorem using the Law of Total Probability.

Frequentist vs. Bayesian

- ▶ Frequentist do not assign probability to hypothesis
 - ▶ A day is 24 hour, but measurement comes with uncertainties, we can model the uncertainty
- ▶ Bayesian assigns probability to hypotheses
 - ▶ $P(B) = P(\text{Hypothesis})$ **Prior**
 - ▶ $P(A|B) = P(\text{Data}|\text{Hypothesis})$ **Likelihood**
 - ▶ $P(B|A) = P(\text{Hypothesis}|\text{Data})$ **Posterior**
 - ▶ $P(A) = P(\text{Data})$ **Evidence**

Discussion Question

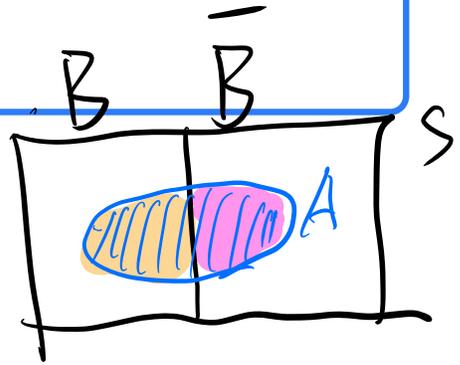

Consider any two events A and B . Choose the expression that's equivalent to

- a) $P(A)$
- b) $1 - P(B)$
- c) $P(B)$
- d) $P(\bar{B})$
- e) 1

$$\begin{aligned} & P(B|A) + P(\bar{B}|A) \\ &= \frac{P(B \cap A)}{P(A)} + \frac{P(\bar{B} \cap A)}{P(A)} \\ &= \frac{P(B \cap A) + P(\bar{B} \cap A)}{P(A)} \end{aligned}$$

law of total probability

$$= \frac{P(A)}{P(A)} = 1$$

Example: prosecutor's fallacy¹

A bank was robbed yesterday by one person. Consider the following facts about the crime:

- ▶ The person who robbed the bank wore Nikes.
- ▶ Of the 10,000 other people who came to the bank yesterday, only 10 of them wore Nikes.

The prosecutor finds the prime suspect, and states that “given this evidence, the chance that the prime suspect was not at the crime scene is 1 in 1,000”.

innocent

$$\frac{10}{10000} = P(\text{Nikes} | \text{innocent})$$

1. What is wrong with this statement?

$$P(\text{Nikes} | \text{innocent}) \neq P(\text{innocent} | \text{Nikes})$$

2. Find the probability that the prime suspect is guilty given only the evidence in the exercise.

¹exercise from [Theory Meets Data textbook](#) by Ani Adhikari

	guilty	innocent
--	--------	----------

Nikes

1

10
 \triangleleft

} 11 Nike Weavers

no Nikes

0

9990

10,000 innocent people in total

$$P(\text{innocent} | \text{Nikes}) = \frac{P(\text{innocent} \cap \text{Nikes})}{P(\text{Nikes})}$$

$$P(\text{innocent}) = \frac{10000}{10001} \approx 99.9\% = \frac{10}{11} \approx 90\%$$

Independence

Updating probabilities

- ▶ Bayes' theorem describes how to update the probability of one event, given that another event has occurred.

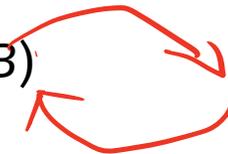

$$\overset{\text{New}}{P(B|A)} = \frac{\overset{\text{old}}{P(B)} \cdot P(A|B)}{P(A)}$$

- ▶ $P(B)$ can be thought of as the “prior” probability of B occurring, before knowing anything about A .
- ▶ $P(B|A)$ is sometimes called the “posterior” probability of B occurring, given that A occurred.
- ▶ What if knowing that A occurred doesn't change the probability that B occurs? In other words, what if

$$P(B|A) = P(B)$$

Independent events

- ▶ A and B are **independent events** if one event occurring does not affect the chance of the other event occurring.

$$P(B|A) = P(B) \quad \text{and} \quad P(A|B) = P(A)$$

- ▶ Otherwise, A and B are **dependent events**.
- ▶ Using Bayes' theorem, we can show that if one of the above statements is true, then so is the other.

Suppose $P(B|A) = P(B)$, show $P(A|B) = P(A)$

Bayes: $P(B|A) = \frac{P(B) \cdot P(A|B)}{P(A)} \Rightarrow P(A) \cdot P(B|A) = P(B) \cdot P(A)$

$\Rightarrow P(A|B) = P(A)$

Independent events

- ▶ **Equivalent definition:** A and B are independent events if

$$P(A \cap B) = P(A) \cdot P(B)$$

- ▶ To check if A and B are independent, use whichever is easiest:

- ▶ $P(B|A) = P(B)$.

- ▶ $P(A|B) = P(A)$.

- ▶ $P(A \cap B) = P(A) \cdot P(B)$.

$$P(A \cap B) = P(A) \cdot P(B|A)$$

$$= P(A) \cdot P(B)$$

True when A, B
are independent
only.

Mutual exclusivity and independence

don't overlap
can't happen at the same time
disjoint

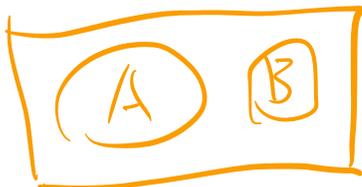

satisfy:

- ① $P(A|B) = P(A)$
- ② $P(B|A) = P(B)$
- ③ $P(A \cap B) = P(A) \cdot P(B)$

Discussion Question

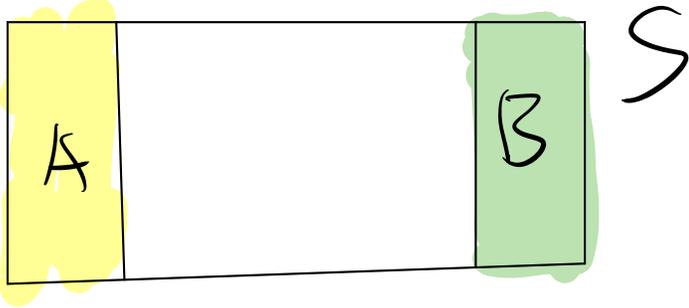

Suppose A and B are two events with non-zero probabilities. Is it possible for A and B to be both mutually exclusive and independent?

- a) Yes
- b) No

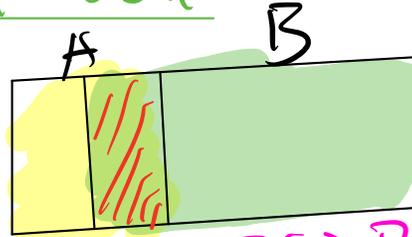

if A, B independent $\Rightarrow P(B|A) = P(B)$
if A, B are mutually exclusive,
 $P(B|A) = \frac{P(A \cap B)}{P(A)} = 0 = P(B)$
told $P(B) = 0$

Mutually Exclusive

Dependent

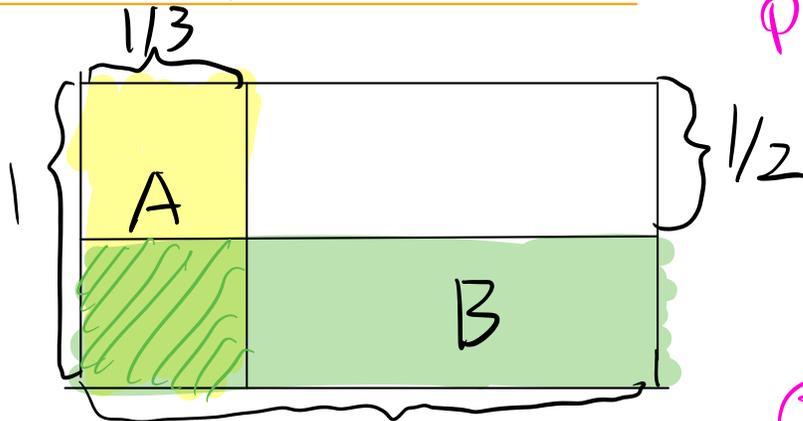

$$\textcircled{2} P(A \cap B) = P(A) \cdot P(B)$$

$$\textcircled{2} P(A|B) = P(A)$$

$$\textcircled{0} P(B|A) = P(B)$$

Independent

$$\textcircled{0} P(B|A) = \frac{1}{2} \text{ Same}$$

$$P(B) = \frac{1}{2}$$

$$\textcircled{2} P(A|B) = \frac{1}{3} \text{ Same}$$

$$P(A) = \frac{1}{3}$$

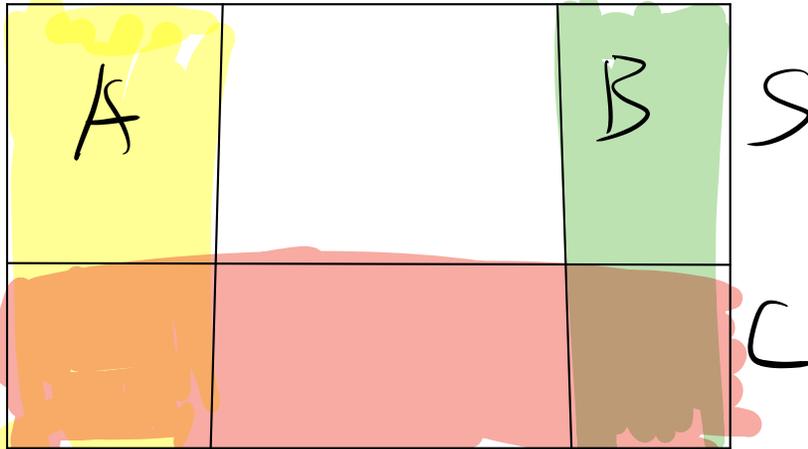

$$\textcircled{3} P(A \cap B) = \frac{1}{6} = \frac{1}{2} \cdot \frac{1}{3} = P(B) \cdot P(A)$$

Example: Venn diagrams

For three events A, B, and C, we know that

- ▶ A and C are independent,
- ▶ B and C are independent,
- ▶ A and B are mutually exclusive,
- ▶ $P(A \cup C) = \frac{2}{3}$, $P(B \cup C) = \frac{3}{4}$, $P(A \cup B \cup C) = \frac{11}{12}$.

Find $P(A)$, $P(B)$, and $P(C)$.

$$\begin{aligned}
 & \rightarrow P(A \cup C) \\
 & = P(A) + P(C) \\
 & \quad - P(A \cap C)
 \end{aligned}$$

$$\begin{aligned}
 & = P(A) + P(C) \\
 & \quad - P(A) \cdot P(C)
 \end{aligned}$$

Change Notation

$$\begin{aligned}
 a & = P(A) \\
 b & = P(B) \\
 c & = P(C)
 \end{aligned}$$

$$\begin{cases} P(A \cup C) = \frac{2}{3} \Rightarrow a + c - a \cdot c = \frac{2}{3} \dots \textcircled{1} \\ P(B \cup C) = \frac{3}{4} \Rightarrow b + c - b \cdot c = \frac{3}{4} \dots \textcircled{2} \\ P(A \cup B \cup C) = \frac{11}{12} \Rightarrow a + b + c - a \cdot c - b \cdot c = \frac{11}{12} \dots \textcircled{3} \end{cases}$$

$$\textcircled{3} \quad a + b + c - \underbrace{(a + c - \frac{2}{3})}_{\textcircled{1}} - \underbrace{(b + c - \frac{3}{4})}_{\textcircled{2}} = \frac{11}{12}$$

$$-c + \frac{2}{3} + \frac{3}{4} = \frac{11}{12}$$

$$c = \frac{8}{12} + \frac{9}{12} - \frac{11}{12} = \frac{6}{12} = \frac{1}{2}$$

Use $\textcircled{1}$ to find a

$$\textcircled{1} \Rightarrow a + \frac{1}{2} - a \cdot \frac{1}{2} = \frac{2}{3} \Rightarrow a = \frac{1}{3}$$

use $\textcircled{2}$ to find

$$b =$$

$$b + \frac{1}{2} - b \cdot \frac{1}{2} = \frac{3}{4}$$

$$\frac{1}{2}b = \frac{1}{4}$$

$$b = \frac{1}{2}$$

Example: cards

♥: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

♦: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

♣: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

♠: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

- ▶ Suppose you draw two cards, one at a time.
 - ▶ A is the event that the first card is a heart.
 - ▶ B is the event that the second card is a club.
- ▶ If you draw the cards **with** replacement, are A and B independent?
- ▶ If you draw the cards **without** replacement, are A and B independent?

Example: cards

♥: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

♦: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

♣: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

♠: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

- ▶ Suppose you draw one card from a deck of 52.
 - ▶ A is the event that the card is a heart.
 - ▶ B is the event that the card is a face card (J, Q, K).
- ▶ Are A and B independent?

Assuming independence

- ▶ Sometimes we assume that events are independent to make calculations easier.
- ▶ Real-world events are almost never exactly independent, but they may be close.

Example: breakfast

1% of UCSD students are DSC majors. 25% of UCSD students eat avocado toast for breakfast. Assuming that being a DSC major and eating avocado toast for breakfast are independent:

1. What percentage of DSC majors eat avocado toast for breakfast?
2. What percentage of UCSD students are DSC majors who eat avocado toast for breakfast?

Summary

Summary

- ▶ Two events A and B are **independent** when knowledge of one event does not change the probability of the other event.
- ▶ There are there equivalent definitions of independence:
 - ▶ $P(B|A) = P(B)$
 - ▶ $P(A|B) = P(A)$
 - ▶ $P(A \cap B) = P(A) \cdot P(B)$
