Lecture 22 – Independence and Conditional Independence

DSC 40A, Winter 2024

Announcements

- Homework 7 released last Friday, due this upcoming Friday.
- I will release a mock midterm 2 today, more information about the 2nd midterm on Wednesday lecture.
- We have normal discussion today, next Monday's discussion is converted to a review session.
- Great source of practice problems for recent content: stat88.org/textbook.
- Also check out the Probability Roadmap on the resources tab of the course website.

Agenda

- Independence.
- Conditional independence.

Independence

Independent events

- A and B are independent events if one event occurring does not affect the chance of the other event occurring.
- To check if A and B are independent, use whichever is easiest:

$$\blacktriangleright P(A|B) = P(A).$$

▶
$$P(A \cap B) = P(A) \cdot P(B)$$
.

Example: cards

♥: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
♦: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
♠: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
♠: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

Suppose you draw two cards, one at a time.

- A is the event that the first card is a heart.
- B is the event that the second card is a club.
- If you draw the cards with replacement, are A and B independent?
- If you draw the cards without replacement, are A and B independent?

Example: cards

♥: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
♦: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
±: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
±: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

Suppose you draw one card from a deck of 52.

- A is the event that the card is a heart.
- B is the event that the card is a face card (J, Q, K).
- Are A and B independent?

Assuming independence

- Sometimes we assume that events are independent to make calculations easier.
- Real-world events are almost never exactly independent, but they may be close.

Example: breakfast

1% of UCSD students are DSC majors. 25% of UCSD students eat avocado toast for breakfast. Assuming that being a DSC major and eating avocado toast for breakfast are independent:

1. What percentage of DSC majors eat avocado toast for breakfast?

2. What percentage of UCSD students are DSC majors who eat avocado toast for breakfast?

Conditional independence

Conditional independence

- Sometimes, events that are dependent become independent, upon learning some new information.
- Or, events that are independent can become dependent, given additional information.

Example: cards

♥: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
♦: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
♠: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, A
♠: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

- Your dog ate the King of Clubs. Suppose you draw one card from a deck of 51.
 - A is the event that the card is a heart.
 - B is the event that the card is a face card (J, Q, K).
- Are A and B independent?

Example: cards

♥: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
♦: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A **±**: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, A **±**: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A

- Your dog ate the King of Clubs. Suppose you draw one card from a deck of 51.
 - A is the event that the card is a heart.
 - B is the event that the card is a face card (J, Q, K).
- Suppose you learn that the card is red. Are A and B independent given this new information?

Conditional independence

Recall that A and B are independent if

 $P(A \cap B) = P(A) \cdot P(B)$

A and B are conditionally independent given C if

 $P((A \cap B)|C) = P(A|C) \cdot P(B|C)$

Given that C occurs, this says that A and B are independent of one another.

Assuming conditional independence

- Sometimes we assume that events are conditionally independent to make calculations easier.
- Real-world events are almost never exactly conditionally independent, but they may be close.

Example: Harry Potter and Discord

Suppose that 50% of UCSD students like Harry Potter and 80% of UCSD students use Discord. What is the probability that a random UCSD student likes Harry Potter and uses Discord, assuming that these events are conditionally independent given that a person is a UCSD student?

Independence vs. conditional independence

- Is it reasonable to assume conditional independence of
 - liking Harry Potter
 - using Discord

given that a person is a UCSD student?

Is it reasonable to assume independence of these events in general, among all people?

Discussion Question

Which assumptions do you think are reasonable?

- a) Both
- b) Conditional independence only
- c) Independence (in general) only
- d) Neither

Independence vs. conditional independence

In general, there is **no relationship** between independence and conditional independence. All four scenarios below are possible.

- Scenario 1: A and B are independent. A and B are conditionally independent given C.
- Scenario 2: A and B are independent. A and B are not conditionally independent given C.
- Scenario 3: A and B are not independent. A and B are conditionally independent given C.
- Scenario 4: A and B are not independent. A and B are not conditionally independent given C.

- Consider a sample space S = {1, 2, 3, 4, 5, 6} where all outcomes are equally likely.
- ▶ For each scenario, specify events *A*, *B*, and *C* that satisfy the given conditions. (e.g. *A* = {2, 5, 6})
- Choose events that are neither impossible nor certain, i.e. 0 < P(A), P(B), P(C) < 1.</p>

Scenario 1: A and B **are** independent. A and B **are** conditionally independent given C.

- Consider a sample space S = {1, 2, 3, 4, 5, 6} where all outcomes are equally likely.
- ▶ For each scenario, specify events *A*, *B*, and *C* that satisfy the given conditions. (e.g. *A* = {2, 5, 6})
- Choose events that are neither impossible nor certain, i.e. 0 < P(A), P(B), P(C) < 1.</p>

Scenario 2: A and B **are** independent. A and B **are not** conditionally independent given C.

- Consider a sample space S = {1, 2, 3, 4, 5, 6} where all outcomes are equally likely.
- ▶ For each scenario, specify events *A*, *B*, and *C* that satisfy the given conditions. (e.g. *A* = {2, 5, 6})
- Choose events that are neither impossible nor certain, i.e. 0 < P(A), P(B), P(C) < 1.</p>

Scenario 3: A and B are not independent. A and B are conditionally independent given C.

- Consider a sample space S = {1, 2, 3, 4, 5, 6} where all outcomes are equally likely.
- ▶ For each scenario, specify events *A*, *B*, and *C* that satisfy the given conditions. (e.g. *A* = {2, 5, 6})
- Choose events that are neither impossible nor certain, i.e. 0 < P(A), P(B), P(C) < 1.</p>

Scenario 4: A and B are not independent. A and B are not conditionally independent given C.

Summary

Summary

Two events A and B are independent when knowledge of one event does not change the probability of the other event.

Equivalent conditions: P(B|A) = P(B), P(A|B) = P(A), $P(A \cap B) = P(A) \cdot P(B)$.

- Two events A and B are conditionally independent if they are independent given knowledge of a third event, C.
 Condition: P((A ∩ B)|C) = P(A|C) · P(B|C).
- In general, there is no relationship between independence and conditional independence.
- Next time: Using Bayes' theorem and conditional independence to solve the classification problem in machine learning.
